

# Disambiguation

- The textbook talks about managing **processes**
  - Pintos does not have processes at all but **"kernel threads"**
  - In your system programming class, you could create multiple **"user threads"** under a process
- ➔ Let's simplify things just for this week :

process ~ **thread**

# Program vs Thread

- **Program** : static data on some storage
  - **Thread** : instance of a program execution
- ➔ Different threads executing the same program can run concurrently
