## Process creation on Unix using exec

```
int exec(char *prog, char *argv[])
```

- 1. Stops the current process
- 2. Loads the program "prog" into the process address space
- 3. Initializes hardware context and args for the new program
- 4. Places the PCB onto the ready queue
- → Actually, exec does not create a new process

## Spawning

- ✓ Most calls to fork are followed by exec (a.k.a spawn)
  - · minish.sh
  - · redirsh.c
  - · pipesh.c
