## SRTF - Shortest-Remaining-Time-First (preemptive)

<b>Process</b>	<b>Arrival Time</b>	<b>Burst Time</b>
$P_1$	0	7
$P_2$	2	4
$P_3$	4	1
$P_4$	5	4

→ if a new thread arrives with CPU burst length less than remaining time of current executing thread, preempt current thread

- Good: optimize waiting time
- Problem: can lead to starvation

## RR - Round Robin (preemptive)

→ Each job is given a time slice called a quantum, preempt job after duration of quantum, move to back of FIFO queue

- ✓ Good: fair allocation of CPU, low waiting time (interactive)
- Problem: no priority between threads
