(Good) Producers Consumer using semaphores

```
sem_init(not_full, n)
sem_init(not_empty, 0)
sem_init(mutex, 1)
```

```
void producer () {
                                      void consumer () {
  while (1) {
                                        while (1) {
     item := produce()
                                           sem wait(not empty)
     sem wait(not full)
                                           sem wait(mutex)
     sem wait(mutex)
                                           item := read(buffer)
     write (buffer, item)
                                           sem signal(mutex)
     sem signal(mutex)
                                           sem signal (not full)
     sem signal(not empty)
                                           consume (item)
```

How to avoid deadlocks

Avoiding deadlock using primitive synchronization mechanisms (locks and semaphores) is hard (cf chapter 32)
